In Between

Residential – Commercial Building

The main concern behind this project was the lack of social spaces and connection with nature in residential buildings. The primary design goal was to connect the three building volumes and create public spaces both at ground level and across the upper floors. This was achieved through an elevated pedestrian bridge that links the buildings and provides shared spaces for social interaction, walking, and experiencing nature.
The project was modeled in Autodesk Revit, and the renderings were enhanced using Gendo AI.

[TODO: year]	[TODO: site / location]	[TODO: course, studio, tutor]

In Between

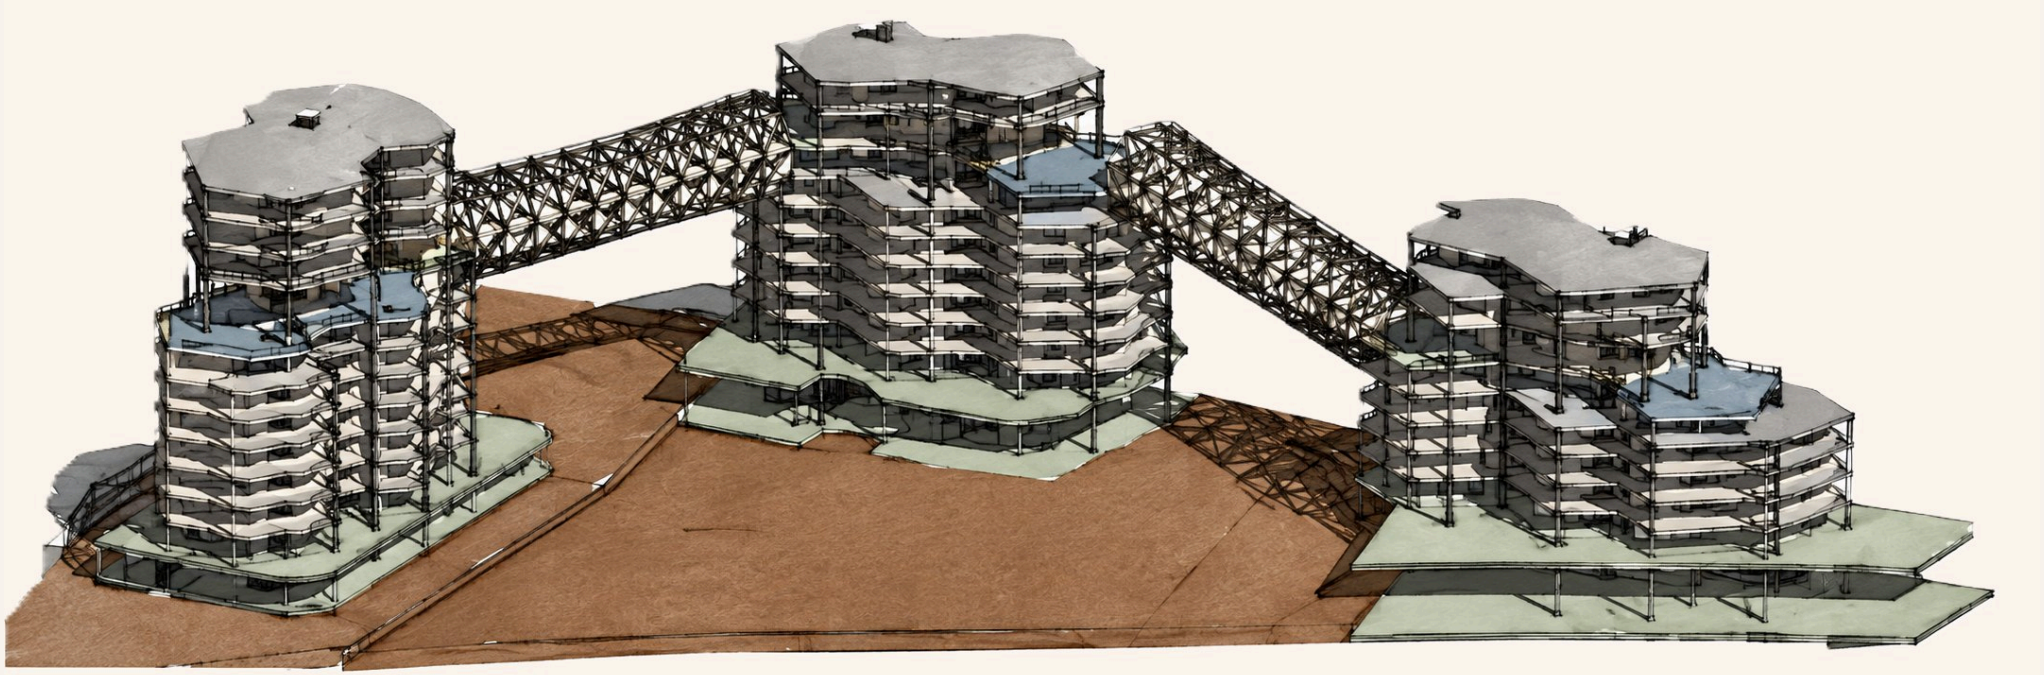

The design process began with shaping three building volumes according to the site geometry. The volumes were arranged to respond to the site's form and functional requirements. Pedestrian bridges were then introduced to connect the three buildings at their designated public levels, creating a continuous elevated pathway that integrates circulation, social interaction, and shared public spaces throughout the complex.

Site Plan

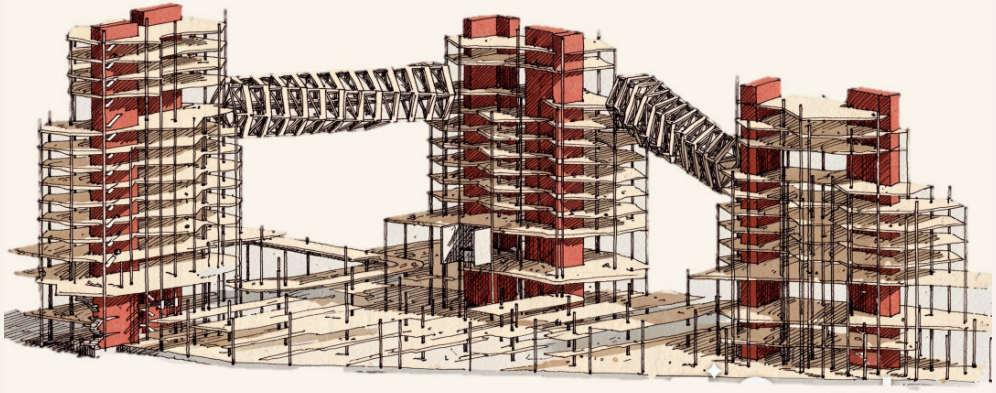

The three building volumes are arranged according to the site geometry. Each residential unit benefits from abundant natural daylight and multiple balconies. The main entrance is located on the northern side of the site to minimize traffic congestion on the main highway. At ground level, landscape design and integrated green spaces create a welcoming public environment for walking, relaxation, and social interaction.

Rasta Sport Complex

Sport and Mental Wellness Center

The Sport and Mental Wellness Center approaches architecture as an essential part of the human well-being experience. Spatial proportions, natural light, landscape, color, and the connection between indoor and outdoor environments are carefully considered to create spaces that support activity, comfort, concentration, and relaxation.

Rasta Sport Complex

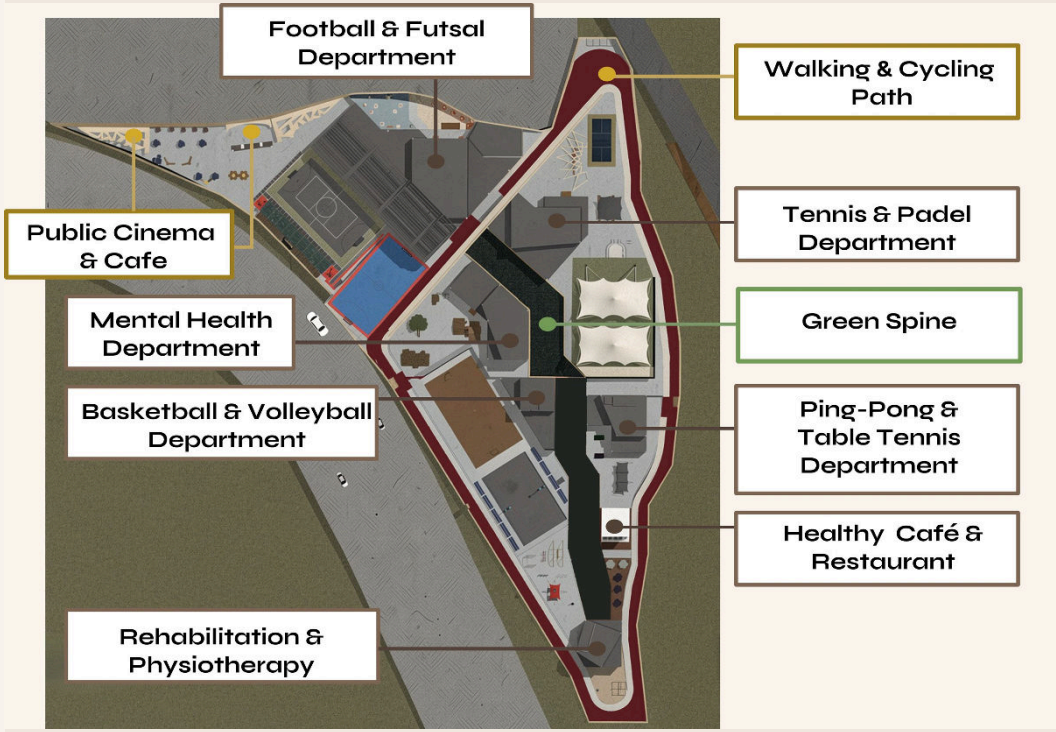

Based on the site shape and the concept of combining architecture with nature, a central Green Spine connects all departments. The building masses are arranged along this path, while a loop of walking and cycling paths surrounds the site. Outdoor sports courts are placed according to each department's needs, providing indoor, semi-open, and outdoor spaces with direct access to nature.

Zoning and Spatial Organization

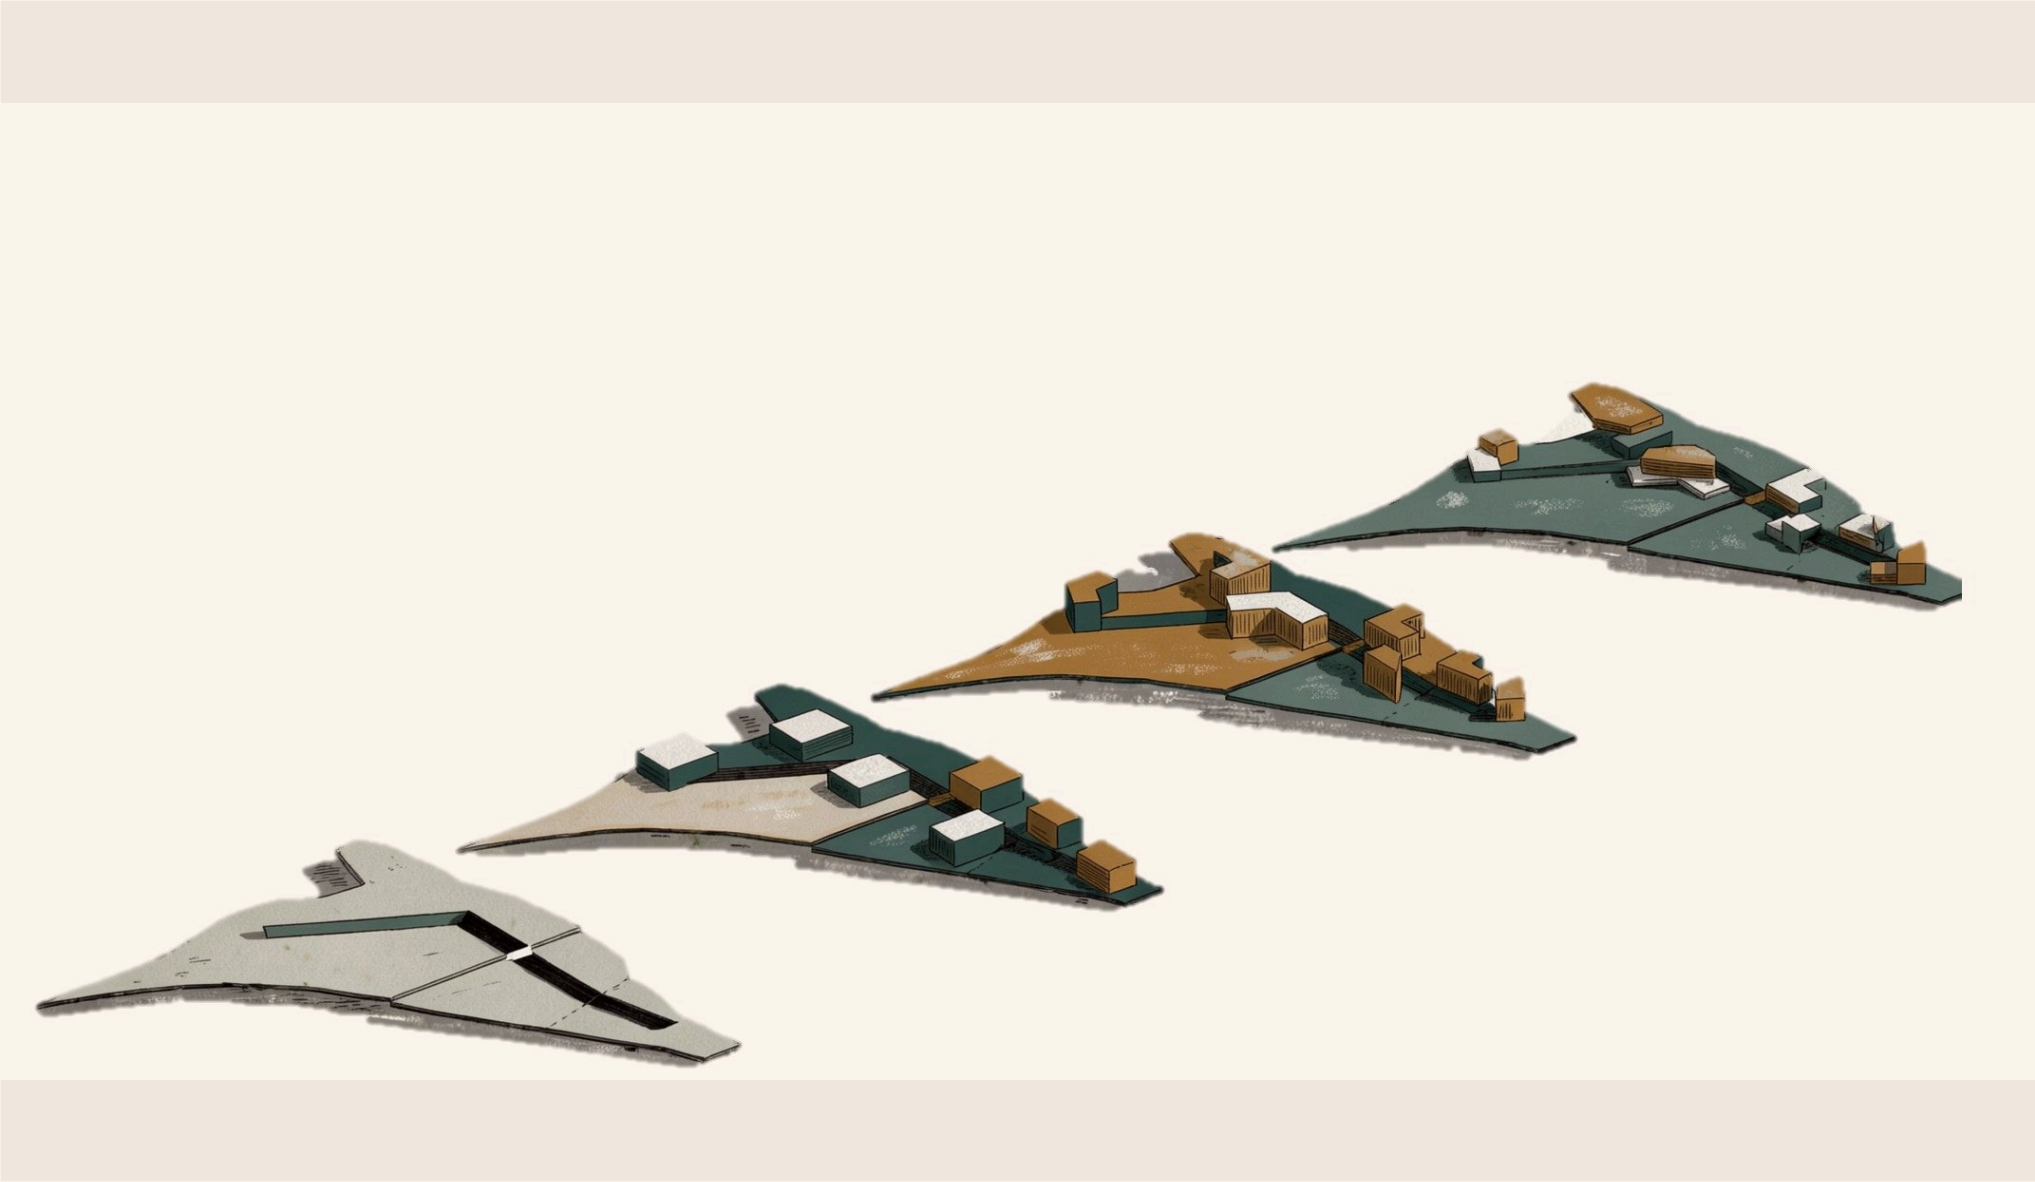

The site is organized into specialized sports and wellness departments, each positioned according to its functional requirements and spatial relationships. The Green Spine acts as the main connecting element, providing a clear circulation route between departments while integrating landscape into the overall design. A peripheral walking and cycling path encourages active movement throughout the site, while outdoor sports facilities and shared amenities enhance accessibility, interaction, and the connection between architecture and nature.

Plan

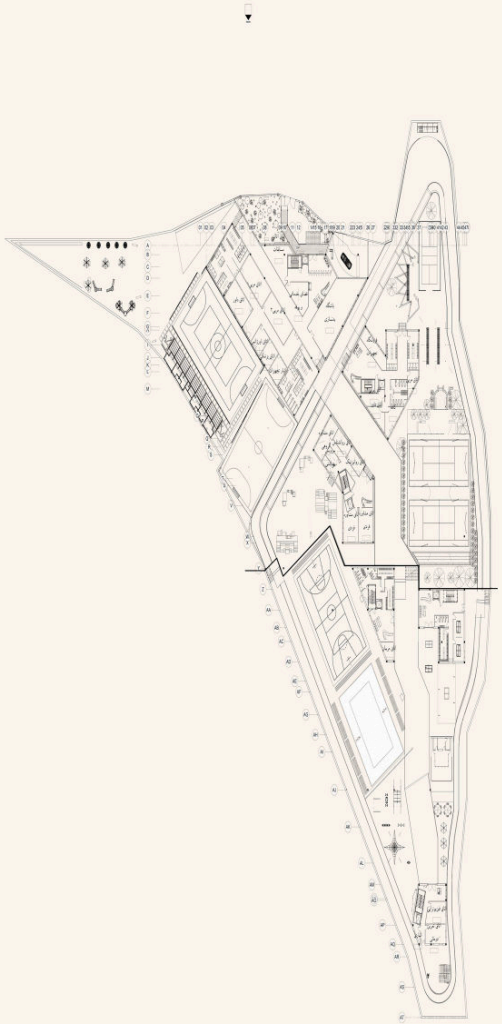

Due to the site's slope, the floor plan was divided into two levels.

Children Hospital

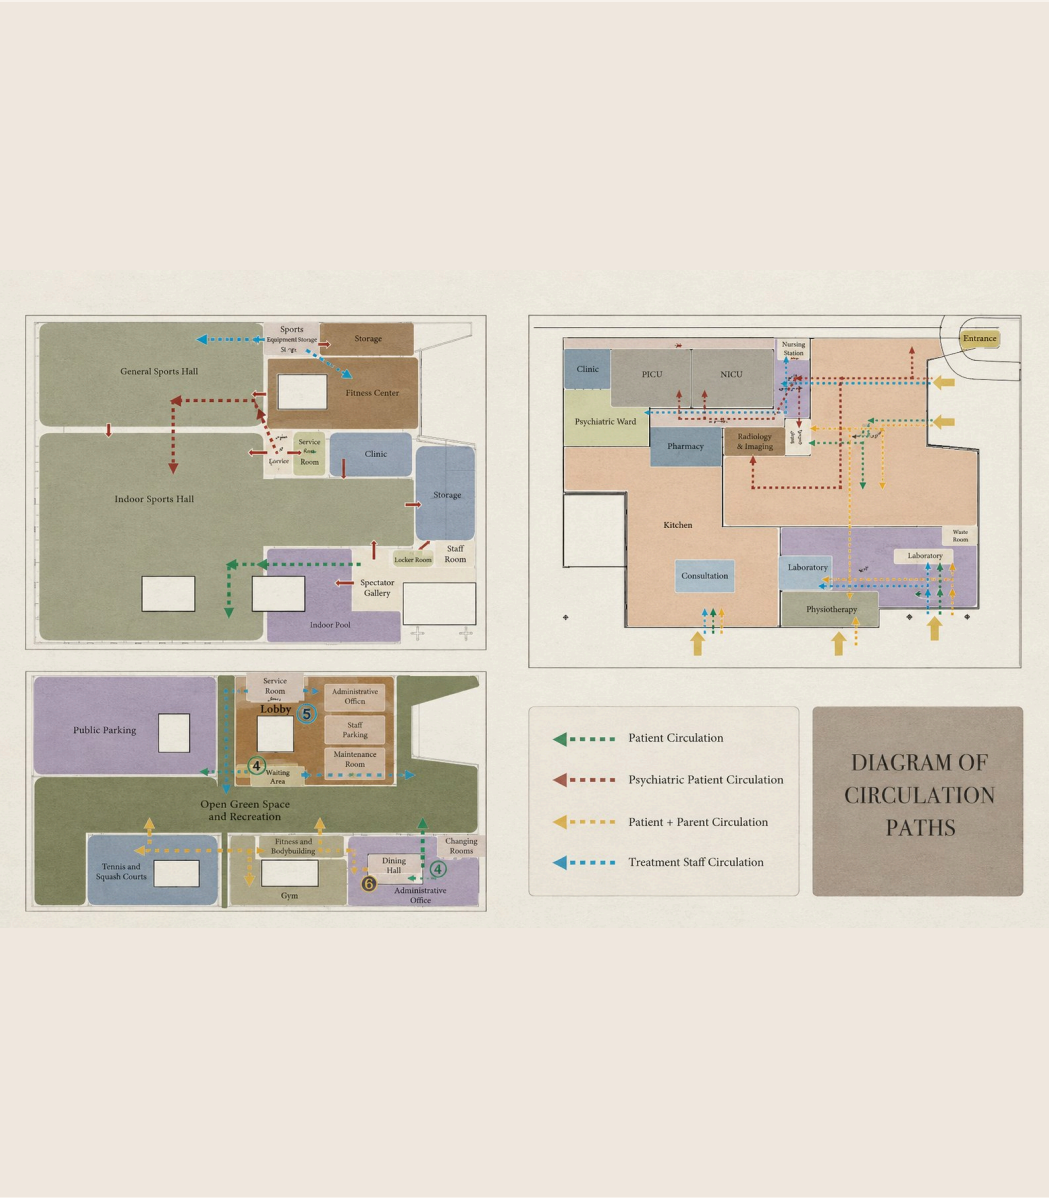

Healthcare

Inspired by LEGO blocks, the project explores modular forms, varied volumes, and vibrant colors to create a playful, child-friendly architectural identity. The concept aims to transform the hospital from a purely clinical environment into a welcoming and engaging space that supports children's emotional well-being and recovery. Through the integration of natural light, green spaces, play areas, and healing gardens, the design establishes a connection between architecture, nature, and the needs of young patients and their families.

Iran Pavilion

Exhibition Pavilion — Dubai Expo

The Iran Pavilion at Dubai Expo is inspired by the natural landscape of Kenarak in Sistan and Baluchestan. The project combines traditional Iranian architecture, earth-based construction, and cultural heritage to create an immersive experience. Through interactive galleries, Persian art, poetry, music, pottery, and dance, the pavilion introduces Iran's rich cultural identity while establishing a connection between architecture, nature, and tradition.

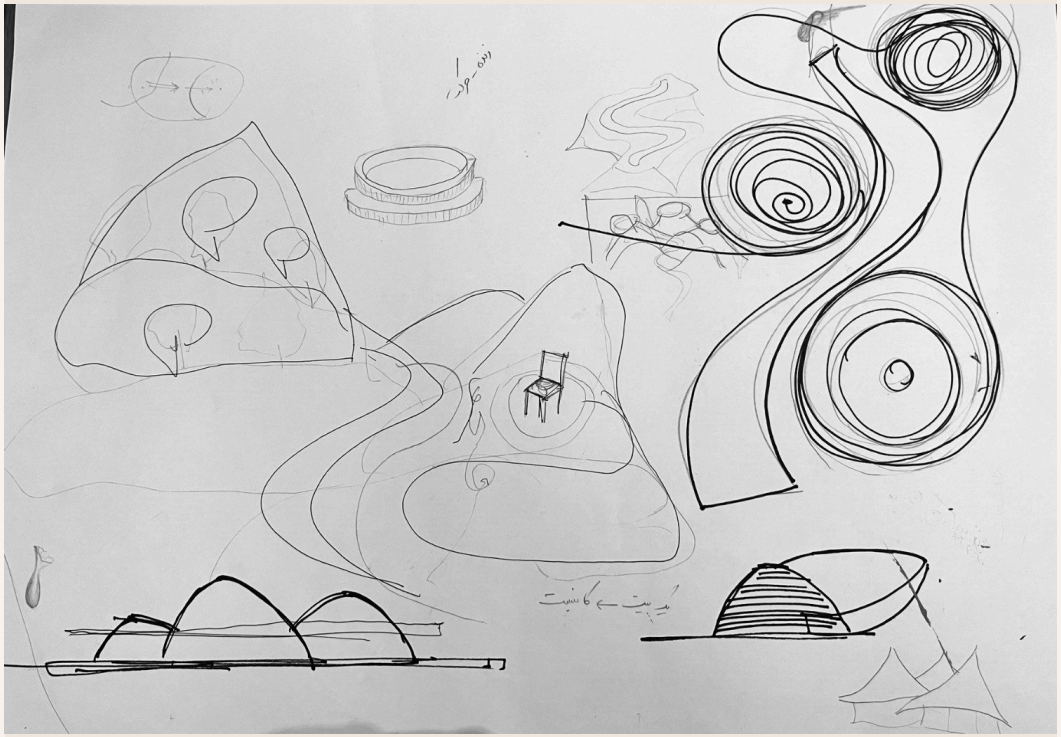

YEAR	LOCATION	COURSE / STUDIO
[TODO: year]	[TODO: site / location]	[TODO: course, studio, tutor]

Iran Pavilion

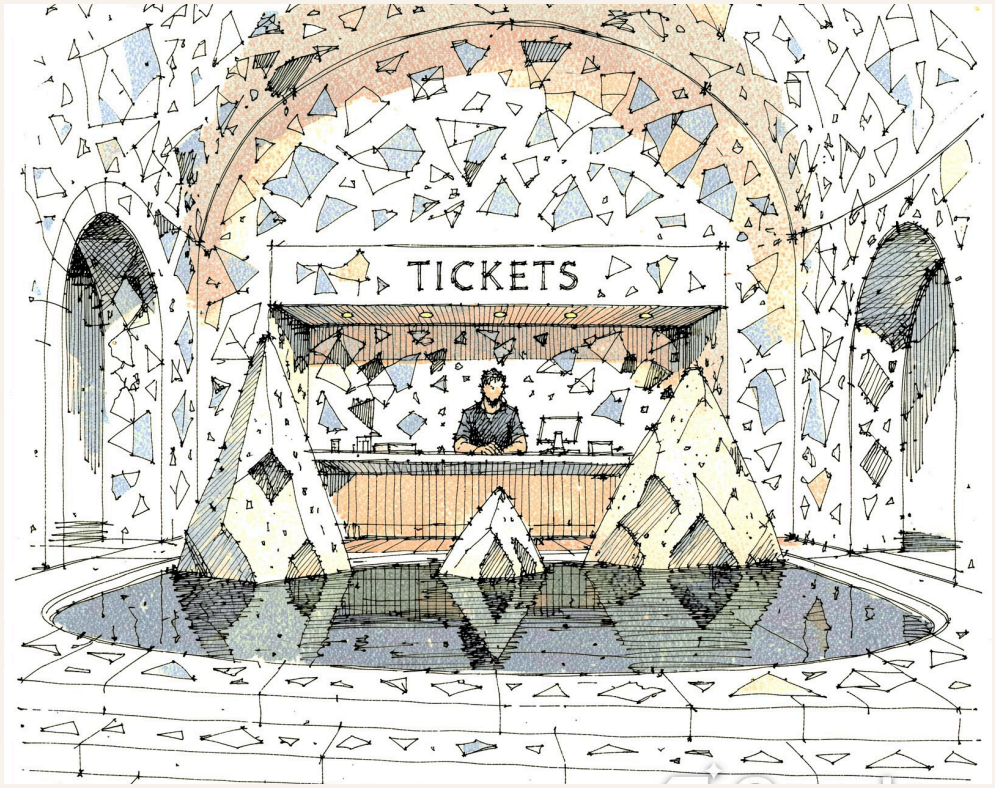

The Iran Pavilion is inspired by the unique landscape of Kenarak in Sistan and Baluchestan, where desert dunes, turquoise water, mountains, and vegetation meet. The design combines nature, traditional Iranian architecture, and cultural heritage to create an immersive experience through light, water, sound, and interactive exhibition spaces.

Super adobe Structural System

Super adobe is an earth-based construction technique developed by Iranian architect Nader Khalili. It uses long polypropylene bags filled with compacted earth to create load-bearing walls and dome-shaped structures. This system connects contemporary architecture with traditional Iranian building methods while offering thermal mass and the potential to reduce reliance on conventional construction materials.

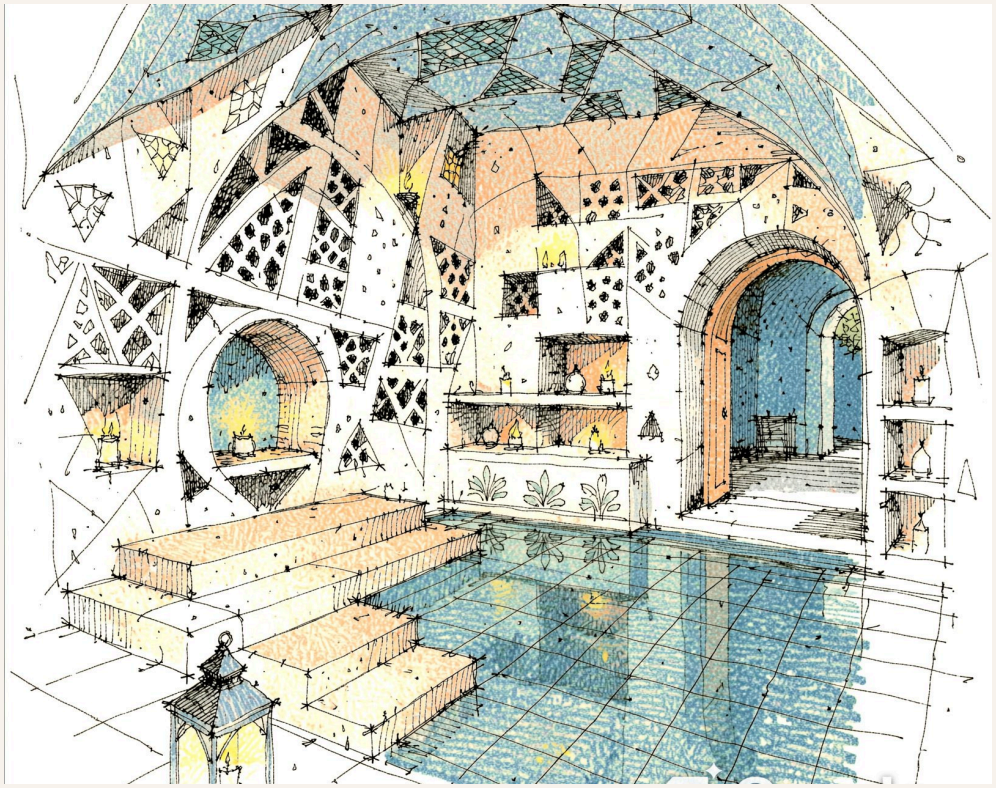

Design Process

Entrance

The entrance features a domed ceiling decorated with traditional Iranian mirror work. Reflective surfaces and a water feature create dynamic light effects, welcoming visitors into the pavilion and introducing its cultural identity.

Shahr-e Farang Gallery

Inspired by a traditional Iranian visual entertainment device, this gallery uses small wall openings to reveal scenes of Iranian culture and history. Subtle lighting, an underground water feature, and a candle-lighting niche create a mysterious and interactive experience.

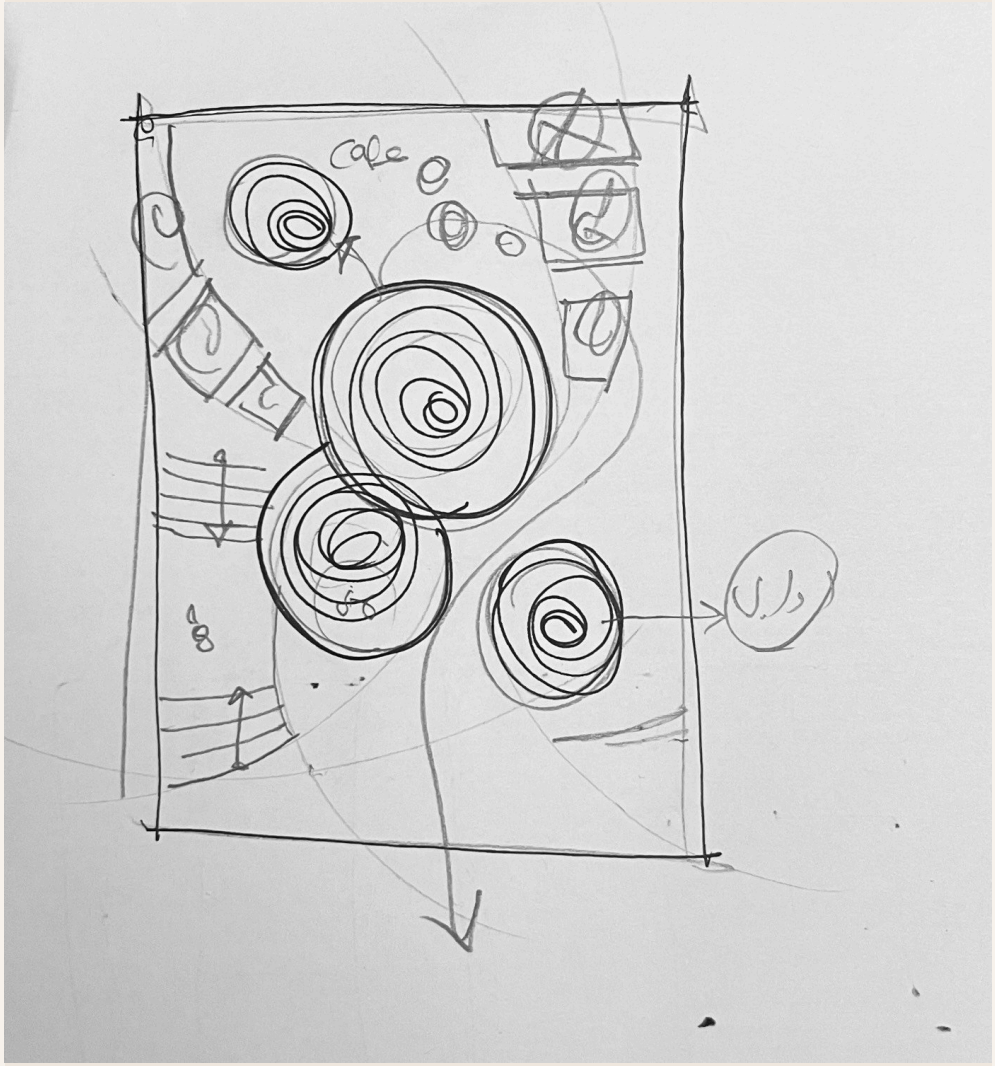

Carpet Gallery

This L-shaped corridor is inspired by traditional Iranian houses. A Persian carpet is integrated into the wall for visitors to touch, while natural light, candlelight, and floral fragrances create a multisensory introduction to Iranian craftsmanship.

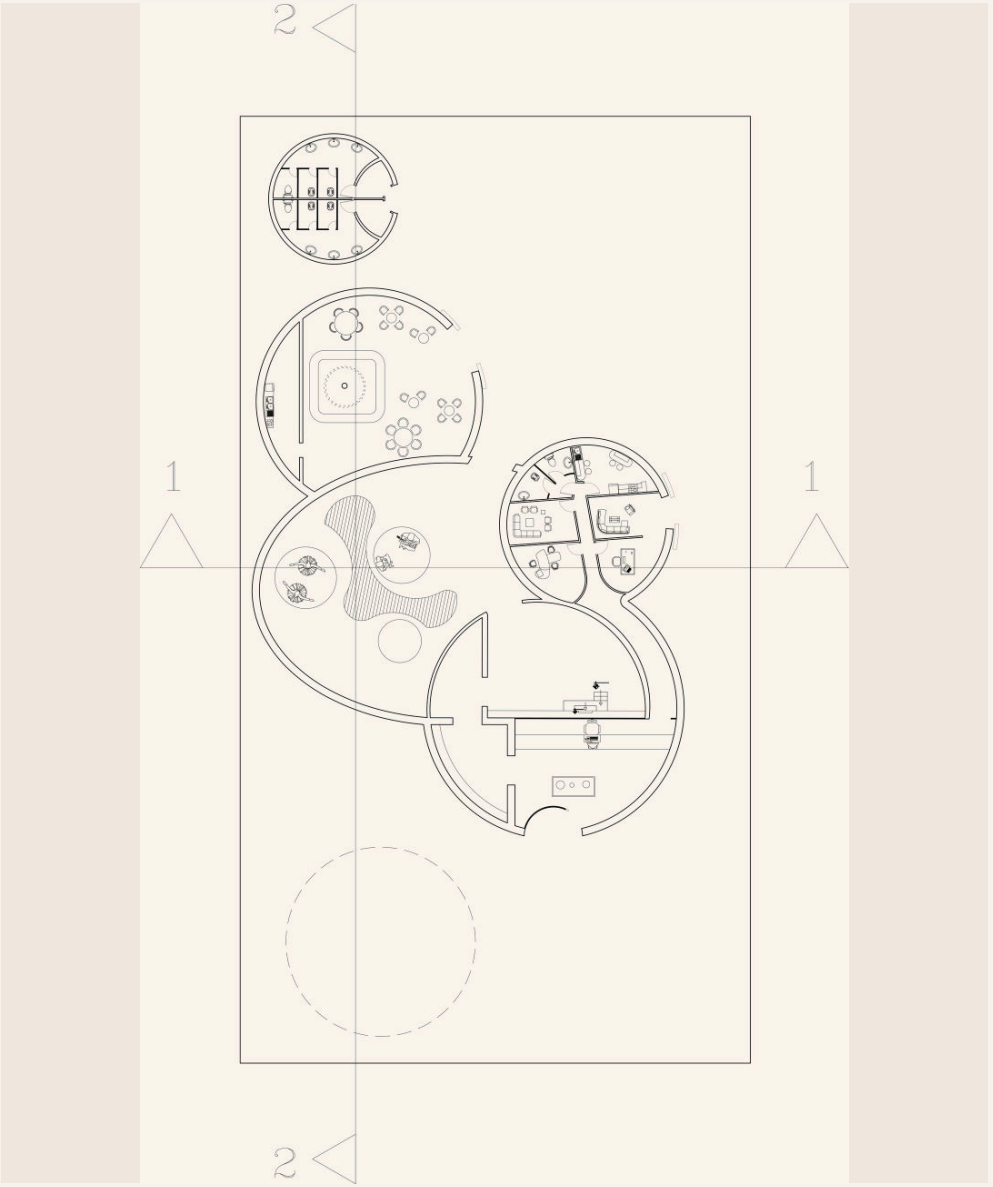

Kenarak Gallery

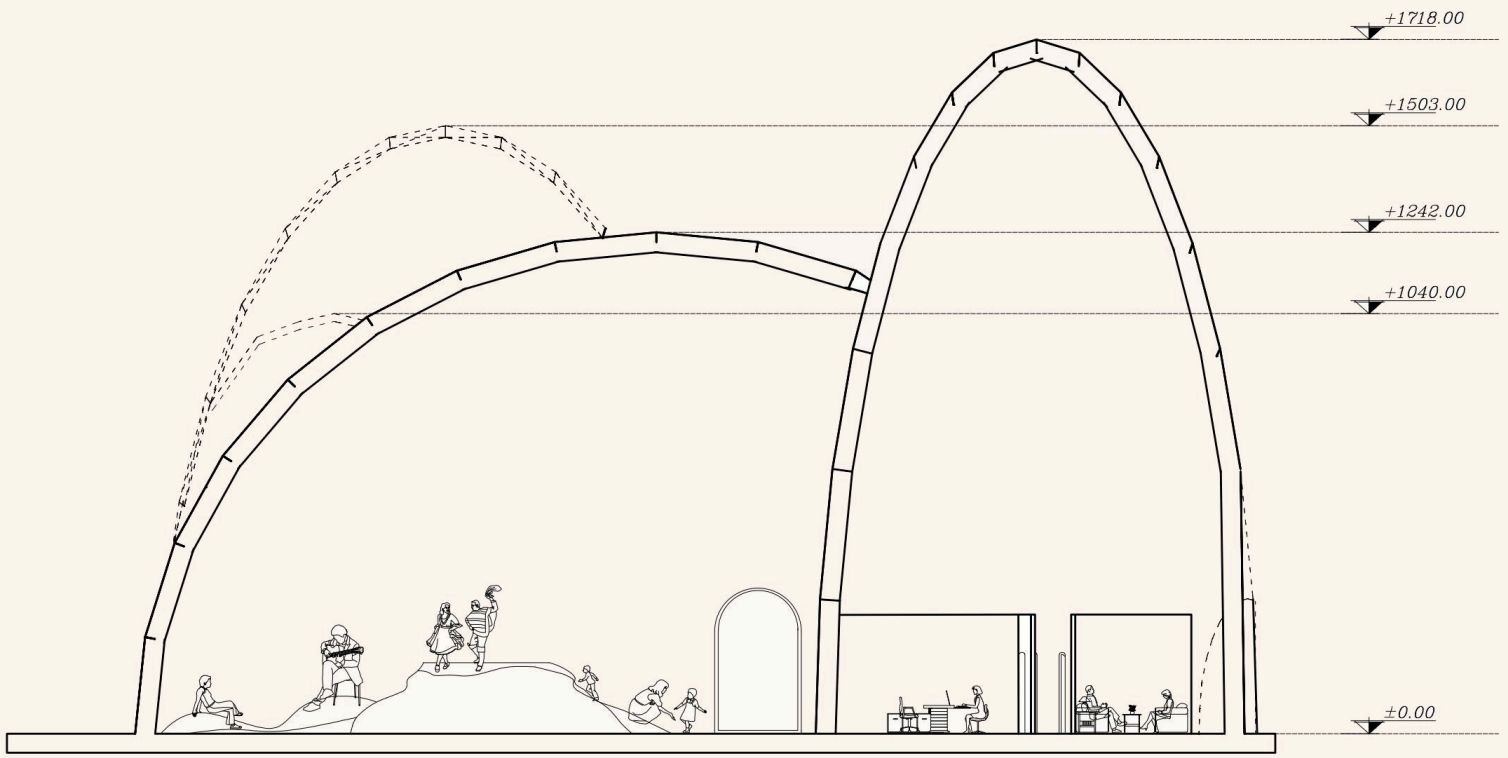

The Konarak Gallery features four earthen hills, each representing an aspect of Iranian culture: Persian poetry, traditional pottery, Iranian music, and folk dance. Visitors walk barefoot through water and sand, interact with performers, listen to poetry and music, and experience traditional crafts. The hills are accessible, allowing visitors to climb up and sit alongside performers, creating an immersive cultural experience inspired by the coastal atmosphere of Kenarak.
